This index sorts the roses by classification or type. In many of the found roses, classification is not yet determined:

- Question mark – the rose appears similar to the class
- Two classes separated by a slash – the rose is probably one or the other. The class appearing first is the strongest contender.
- Two classes separated by a hyphen – the rose has parents from both classes and characteristics of both.
- Classification followed by "X" - the rose is an unknown cross with the listed classification.

The Following are brief descriptions of Classifications of Roses in the Historic Rose Garden

- Alba** Ancient roses which bloom white (sometimes pale pink) and have distinctive grey-green foliage. Hardy, disease-resistant and shade tolerant.
- Banksiae** Banksiae roses bear tiny white or yellow, single or double flowers in clusters. They are vigorous growers, often scrambling up trees or over walls. They are also thornless and bloom in early spring and some are violet-scented.
- Bourbon** Named for a small island in the Indian Ocean, these are the crossovers between ancient and modern roses--**Old Blush** (a China rose) and **Autumn Damask**. They still retain the character of European roses with their strong fragrance, and shrubby growth, but their leaves and stems begin to look more like those of the Hybrid Tea, and they are nearly all repeat flowering.
- Boursault** Boursaults appeared in France early in the nineteenth century and are thought to have been the result of a union between **R. pendulina** and **R. chinensis**. Nearly scent-free, they are vigorous, thornless climbing roses. Flowers are produced on old wood.
- Centifolia** Prized for their full, very double, and extremely fragrant flowers, Centifolias were developed and refined by Dutch breeders in the 17<sup>th</sup> century. Their habit is for the most part branching or pendulous with unusually globular flowers.
- China** China Roses differ in character from many other garden roses being lighter in growth; more open with multi-directional branching of canes. Nearly every branching produces a bud that will grow or flower. This may be because these roses are diploid (cells contain two sets of chromosomes), whereas the majority of garden roses are tetraploid (four sets). Leaves are pointed and the roses bloom repeatedly through the year; into winter when the season is mild. Unlike their European counterparts, colors intensify as blooms age.
- Damask** From ancient times Damask roses were grown for the distillation of rose water and are readily distinguished from other roses by a robustness of growth. They have soft green leaves and large curved prickles. The flowers are mostly of fair size; some are large, and all are showy; sometimes tucked in among the leaves, sometimes above the plant.
- Damask perpetual** See *Hybrid Perpetual*
- Floribunda** Floribundas resulted from crossing Polyanthas with Hybrid Teas. They retain much of the hardiness, freedom and continuity of flower of the Polyanthas, but have much larger blooms. They are compact bushy shrubs with both high-centered hybrid tea type blooms and flat antique-rose type of blooms. There are also single flower cultivars.
- Gallica** Gallicas are probably the oldest cultivated roses in Europe; many of the old varieties are prolific in producing seed, which vegetates freely. They are very hardy, thriving well in the almost any soil. Canes typically have bristles with a few small prickles; leaves are coarse, small, and dull green. These are low-growing, spreading shrubs which sucker easily. The flowers are relatively large and held erect, appearing in mid to late spring. Most Gallicas bloom in strong colors -- deep pink, purple, violet, and mauve, with crimson shadings in between. Many are dramatically striped or mottled; almost all are fragrant.
- Hybrid Banksiae** Naturally occurring seedlings with Banksiae and an unknown rose in their heritage. Flowers are white, usually larger than Banksiae roses. Leaves are nearly identical to Banksiae and there are few prickles. No scent.
- Hybrid Bourbon** Hybrid Bourbon Roses are descended from Provence roses crossed with Bourbon roses and retain characteristics of both.
- Hybrid Bracteata** Bracteata are roses with bracts – persistent leaves - that do not fall off even in winter. They can also produce roots whenever a cane touches the ground.

<b>Hybrid China</b>	Hybrid Chinas originated from Provence (i.e., French) roses crossed with <i>R. chinensis</i> . They retain more characteristics from the French side of their heritage. Their growth is open; foliage is usually smooth and shiny. Prickles are fairly large and numerous. Flowers are produced in clusters, remaining longer on the bush than many. These hybrids are more vigorous in growth than either of their parents, and are in their nature very hardy.
<b>Hybrid Foetida</b>	Mostly once blooming, Hybrid Foetida roses are the origin of the modern yellow rose. They are appreciated for their growth habit, not their fragrance, which can be rather unusual.
<b>Hybrid Laevigata</b>	These are single flowered varieties of medium vigor with good healthy foliage and strong fragrance. Occasional repeat later in the season.
<b>Hybrid multiflora</b>	Multifloras are once blooming and winter hardy. Very vigorous tall and arching plants with very long canes. Lightly thorned with immense flower panicles on lateral shoots.
<b>Hybrid moschata</b>	These roses resulted from a cross with species. Uniquely fragrant, white flowers in trusses, blooming from mid-season onwards. They have dense growth with grey foliage.
<b>Hybrid Musk</b>	Small-flowered shrub roses that are ever-blooming and can be used as climbers. Hybrid Musks bear huge clusters of small blooms that tend to become paler as the flowers age. As a group they are pretty much disease free.
<b>Hybrid Perpetual</b>	Hybrid Perpetuals resulted from an attempt to combine the large flowers and rich scent of Gallica Roses with the perpetual flowering of the Chinas. They have huge flowers on strong shoots and rather short flower stalks and flowers sit down among the leaves. Most are red, pink or white.
<b>Hybrid Polyantha</b>	Crosses of Hybrid Teas with Polyanthas. Originally, they were compact shrubs with flowers, single to semi-double, that were larger than the old style polyanthas or baby ramblers.
<b>Hybrid Sempervirens</b>	Crosses with <i>R. sempervirens</i> . Graceful group of old ramblers that are strong, healthy plants that scramble into trees and cascade a shower of blooms every spring. Nearly evergreen.
<b>Hybrid Rugosa</b>	With one or two exceptions, Rugosa hybrids are very, very thorny. They have large flowers blooming over many months with dark-green glossy, wrinkly foliage turning gold. If left on the plant, flowers give way to orange-red hips high in Vitamin C content. Disease-resistant, these roses will tolerate poor soil and harsh weather.
<b>Hybrid Tea (HT)</b>	The first Hybrid Teas were formed by crossing two existing groups of roses: Hybrid Perpetuals and Teas. <b>La France</b> is considered to be the first of this new group, first sold in 1867. Elegant, urn-shaped buds open into large, full, high-centered flowers carried on long stems. Garden cultivars produce flowers continuously from late spring through frost, and bushes typically grow 3 to 6 feet tall in an upright habit. With more than 7,000 cultivars, HT's are favored by florists and rose exhibitors. HT's are also progenitors of several other modern classes.
<b>Hybrid Villosa</b>	Cross between <i>R. pomifera</i> and an unknown rose. Has a mild, apple fragrance with pink medium-size blooms. Semi-double (9-16 petals), cluster-flowered, in small clusters. Occasional repeat later in the season.
<b>Hybrid Wichurana</b>	Rambling roses bred from <i>R. Wichurana</i> . Tall growers with glossy, dense foliage and prickly, pliable canes. They are either remontant or once-blooming in spring or early summer.
<b>Large Flowered Climber</b>	Primarily Hybrid Tea roses bred for climbing, though they need support. Blooms on new wood; prune early to promote new growth.
<b>Miniature</b>	Miniature roses are hybridized to have small leaves and blooms. They can be grown in containers, borders, hanging baskets, rockeries, or beds; some are climbers and most are hardy.
<b>Moss</b>	Moss Roses are sports of other groups, mainly Damasks and Centifolias. They have numerous small glands on the flower buds and upper stems which create the damp mossy effect. The glands are scented and add to the fragrance of the flowers. They vary much in character and vigor.

<b>Noisette</b>	China and musk roses were crossed to make the only rose class originating in the US. Rarely out of bloom, these roses bring soft yellow or apricot colors to the antique rose palette. Most produce trusses of small flowers in hues of soft white, lemon, or pale pink on wiry, upright bushes.
<b>Odorata</b>	Any of several hybrid bush roses derived from a tea-scented Chinese rose with pink or yellow flowers. These are vigorous, old China roses, often with globular, double flowers white or pale pink. Generally fragrant.
<b>Polyantha</b>	Polyantha roses are known by their clusters of smallish blooms and by lighter than usual green foliage. Cross between a China Rose and a dwarf, repeat-flowering form of <i>R. multiflora</i> . Early polys were pretty, dwarf roses with stiff heads of small, double, short-petaled flowers introduced in the 19 <sup>th</sup> century. When Tea Roses were later introduced into the parentage, more elegant, dwarf roses appeared.
<b>Rambler</b>	Ramblers are climbing, scrambling roses with pliable, very long canes that grow from the base of the plant each year. Large clusters of small flowers are borne on laterals once each season. Most are hybrids of <i>R. wichuraiana</i> or <i>R. multiflora</i> , crossed with some of the smaller types of Polys, HPs, HTs, and Teas.
<b>Segitera Hybrid</b>	Cross between <i>R. Setigera</i> (Prairie Rose) and an unknown rose.
<b>Shrub</b>	This is primarily a class of roses that do not fit into any other class. Most can be grown as specimen shrubs in the garden.
<b>Species</b>	Species roses (sometimes called Wild Roses) are the parents of all the roses grown today. Nearly all have single flowers with five petals. The delicate fragrant flowers bloom for a few brief weeks, followed by glowing hips, all amid generous foliage. Some 200 different species roses exist today.
<b>Spinossisima</b>	Sometimes called "Scotch Roses" because a number of them are native to or have naturalized in Scotland. They are dense, bushy plants, which are disease-resistant and winter hardy. Most bloom once during a season; notable exception is <b>Stanwell Perpetual</b> .
<b>Synstylae hybrid</b>	These climbers are roses that appear superficially to be very widely divergent from each other with the most noticeable feature being their habit of growth. They have a projected column of fused styles at the center of each flower. Lots of small flowers in clusters with a strong musky scent.
<b>Tea</b>	Teas are fragrant forms of Chinese roses and were developed from crosses between <i>R. chinensis</i> and <i>R. gigantea</i> . Like the Noisettes, tea roses brought soft yellow and apricot colors to antique roses. Buds are pointed and open to high-centered flowers on long, but lax stems, often causing the blooms to droop on the plant.
<b>Unknown</b>	These are found roses which are unidentified and the class of rose is not yet apparent. Class (and perhaps name) will be assigned as we learn more about the rose – habit, bloom, foliage, etc.
<b>Hybrid Wichurana</b>	Hybrids developed toward the end of the 19 <sup>th</sup> century and used by many breeders since that time. Apart from a tendency to mildew in a few varieties, these are among our healthiest roses and are easy to grow. They have shiny, long-lasting leaves and very pliable canes suitable for training. Flower once each season with a long flowering period.
